1. Specific Problem Statement

- How can better access to reliable health information for non-English-speaking or underserved communities using voice- and text-based AI agents be enabled?
- Across Tier-1, 2, and 3 populations in Hyderabad, Jharkhand, Chennai and Pune communities are increasingly turning to digital platforms— especially web browsers—as a primary means of accessing health information. This reliance highlights the need to explore how better access to reliable health information can be enabled for non-English-speaking or underserved groups through the use of voice- and text-based AI agents.

2. Target User Segment & Pain Points

- **User Segment:** Everyone with access to mobile phones and Internet, across urban and rural settings, with no specific age group targeted, who rely heavily on digital platforms for information.
 - Daily labourers, no age restrictions, entry-level Android phones, Telugu/Marathi/Hindi/kannada, Single earners of family.
 - The focus includes single earners of families, such as farmers, daily labourers, and working professionals.
- **Pain Points:**
 - Uncertainty about where to find trustworthy health information.
 - Crowd/Long waiting time in the hospitals.
 - High and unpredictable private healthcare costs limit access to timely and reliable health information.
 - Non-availability of healthcare information in preferred local language.

3.What Does Success Look Like?

- $\geq 40\%$ of onboarded users getting accurate information of the healthcare queries.
- Users getting validated information, daily health tips etc., in their preferred local language.
- $\geq 20\%$ of the users getting their cost issues addressed and getting subsidised and reasonable charges
